

COMPANY PROFILE

About Us

Cyberpedia Internet Governance is a pioneering organization overseeing the assignment of globally unique identifiers on the Cyberspace. Our services encompass the management of domain names, Internet protocol addresses, application port numbers in the transport protocols, geo-tracking, and various other critical parameters.

Additionally, our Cyber Arbitration Risk & Reputation Governance division specializes in identifying individuals, organizations, entities, and potential litigation to mitigate risks and ensure compliance with regulations.

Our primary objective is to establish a centralized, verified, stable, secure, and unified real-time data infrastructure. By creating a globally unified namespace, we strive to facilitate the dissemination of verified information across the cyberspace, ensuring global access to reliable data.

Our Profile

As an integral part of the Internet ecosystem, Cyberpedia Internet Governance operates within the framework of the Internet Corporation for Assigned Names and Numbers (ICANN). ICANN is governed by an international board of directors comprising experts from diverse backgrounds, including technical, business, academic, and non-commercial communities.

Our governance model is characterized by decentralization and collaboration. The Cyberpedia Internet Governance network consists of interconnected autonomous groups representing civil society, the private sector, governments, academic and research institutions, as well as national and international organizations.

This multi-stakeholder approach ensures transparency, inclusivity, and efficiency in decision-making processes.

Statement

To be a global leader in Internet governance, ensuring a secure, stable, and unified cyberspace for the dissemination of verified information worldwide.

Mission

Our mission is to oversee the assignment of globally unique identifiers on the Cyberspace, mitigate risks through Cyber Arbitration, and promote compliance, transparency, and collaboration in Internet governance. We aim to establish a centralized and secure real-time data infrastructure for the global community.
